## **EE3009 Data Communications and Networking**

## **Solution to Tutorial 4**

- 1. Maximum throughput for ALOHA is 0.184. Maximum throughput in frames/second =  $\frac{56000}{1000} \times 0.18 \approx 10$
- 2. For slotted ALOHA, throughput is independent of a, therefore, maximum throughput =  $10^8 \times 0.368 = 36.8$  Mbps.

For CSMA/CD,  
L=1500x8 =12000 bits  

$$t_{prop} = \frac{2 \times 500}{2.5 \times 10^8} = 4 \times 10^{-6}$$

$$a = \frac{t_{prop}R}{L} = \frac{4 \times 10^{-6} \times 10^{8}}{1.2 \times 10^{4}} = 3.33 \times 10^{-2}$$

maximum utilization = 
$$\frac{1}{1+(2e+1)a} = 0.8235$$

maximum throughput is 82.35 Mbps.

3. d=100 m from each station to the cabinet

$$v = 2x10^8 \text{ m/sec}$$

$$b = 8$$
 bits

$$L = 1250 \text{ bytes} = 10000 \text{ bits}$$

$$R = 25 \text{ Mbps}$$

$$X = \frac{10000}{25 \times 10^6} = 4 \times 10^{-4} \text{ sec}$$

$$\tau' = \frac{M2d}{v} + \frac{8M}{R} = \frac{200M}{2 \times 10^8} + \frac{8M}{25 \times 10^6} = 1.32 \times 10^{-6} M$$

$$a' = \frac{\tau'}{X} = \frac{1.32 \times 10^{-6} M}{4 \times 10^{-4}} = 3.3 \times 10^{-3} M$$

i) When all stations are allowed an unlimited number of frames/token,  $\rho_{\max}=1$  and  $\rho=\lambda X$ . Therefore,

$$\lambda_{\text{max}} = \frac{1}{4 \times 10^{-4}} = 2500 \text{ frames /sec.}$$

ii) 
$$\rho_{\text{max}} = \frac{1}{1 + a'(1 + \frac{1}{M})}$$
$$\lambda_{\text{max}} = \frac{1}{1 + 3.3 \times 10^{-3} M (1 + \frac{1}{M})} \times \frac{1}{4 \times 10^{-4}} = \frac{2500}{1.0033 + 0.0033 M}$$

iii) 
$$\rho_{\text{max}} = \frac{1}{1 + a'/M} = \frac{1}{1 + 3.33 \times 10^{-3} \, M/M} = 0.997$$

$$\lambda_{\text{max}} = 0.997 \times \frac{1}{4 \times 10^{-4}} = 2492 \text{ frames/sec}$$
